## 1 PROBLEM

Usig the result of Exercise 8 to prove that , If  $A$  and  $B$  are  $n \times n$  matrices over the field  $F$ , then  $AB$  and  $BA$  have precisely the same characteristic values.

## 2 SOLUTION

Given	$A$ and $B$ are $n \times n$ matrices over the field $F$ . In Exercise 8, If $(I - AB)$ is invertible then $(I - BA)$ is invertible.
To prove	$AB$ and $BA$ have precisely the same characteristic values.
Proof	<p>Let suppose <math>c</math> is the characteristic value of <math>AB</math>. Then, <math> cI - AB  = 0</math></p> <p>Here, <math>I</math>, <math>A</math> and <math>B</math> are <math>n \times n</math> matrix.  <math>\implies c^n  I - \frac{1}{c}AB  = 0</math></p> <p>Using the result of Exercise 8,  <math>(I - \frac{1}{c}AB)</math> is non-invertible <math>\implies (I - \frac{1}{c}BA)</math> is also non-invertible.</p> <p> <math>\implies c^n  I - \frac{1}{c}BA  = 0</math>  <math>\implies  cI - BA  = 0</math></p> <p>Hence, <math>AB</math> and <math>BA</math> have precisely the same characteristic value.</p>

Given	$A$ and $B$ are $n \times n$ matrices over the field $F$ .  In Exercise 8, If $(I - AB)$ is invertible then $(I - BA)$ is invertible.
To prove	$AB$ and $BA$ have precisely the same characteristic values.
Observation	We have to show that if $c$ is a characteristic value for $AB$ then $c$ is a characteristic value for $BA$ . Conversely, This is equivalent to the statement if $c$ is not a characteristic value for $AB$ then it is not a characteristic value for $BA$ .
Proof	<p>Suppose that <math>c</math> is not a characteristic value for <math>BA</math>,            this means that <math> cI - BA  \neq 0</math>.</p> <p> <math>\implies c^n  I - \frac{1}{c}BA  \neq 0</math> </p> <p> <math>\therefore (I - \frac{1}{c}BA)</math> is invertible <math>\implies (I - \frac{1}{c}AB)</math> is invertible.  <math>\implies  I - \frac{1}{c}AB  \neq 0</math> </p> <p> <math>\implies c^n  I - \frac{1}{c}AB  = c^n  I - \frac{1}{c}BA  \neq 0</math> </p> <p>Hence, If <math>c</math> is not a characteristic value for <math>AB</math>            then it is not a characteristic value for <math>BA</math>.</p> <p>Hence, <math>AB</math> and <math>BA</math> have precisely the same characteristic value.</p>

Alternative Way,
