1 Problem

Usig the result of Exercise 8 to proove that , If A and B are $n \times n$ matrices over the field F, then AB and BA have precisely the same characteristic values.

2 solution

Given	A and B are $n \times n$ matrices over the field F. In Exercise 8, If $(I - AB)$ is invertible then $(I - BA)$ is invertible.
To prove	AB and BA have precisely the same characteristic values.
Proof	Let suppose c is the characteristic value of AB. Then, $\lvert cI - AB\rvert = 0$ Here, I, A and B are $n \times n$ matrix. $\implies c^n\lvert I - \frac{1}{c}AB\rvert = 0$ Using the result of Exercise 8, $(I - \frac{1}{c}AB)$ is non-invertible $\implies (I - \frac{1}{c}BA)$ is also non-invertible. $\implies c^n\lvert I - \frac{1}{c}BA\rvert = 0$ $\implies \lvert cI - BA\rvert = 0$ AB and BA have precisely the same characteristic value.

Alternative Way,

Given	A and B are $n \times n$ matrices over the field F. In Exercise 8, If $(I - AB)$ is invertible then $(I - BA)$ is invertible.
To prove	AB and BA have precisely the same characteristic values.
Observation	We have to show that if c is a characteristic value for AB then c is a characteristic value for BA. Conversely, This is equivalent to the statement if c is not a characteristic value for AB then it is not a characteristic value for BA.
Proof	Suppose that c is not a characteristic value for BA, this means that $\lvert cI - AB\rvert \neq 0$. $\implies c^n\lvert I - \frac{1}{c}AB\rvert \neq 0$ $\therefore (I - \frac{1}{c}AB)$ is invertible $\implies (I - \frac{1}{c}BA)$ is invertible. $\implies \lvert I - \frac{1}{c}AB\rvert \neq 0$ $\implies c^n\lvert I - \frac{1}{c}AB\rvert = c^n\lvert I - \frac{1}{c}AB\rvert \neq 0$ Hence, If c is not a characteristic value for AB then it is not a characteristic value for BA.
